MONITORAGGIO AMBIENTALE AUTOMATICO SENZA FILI PER USO AGRICOLO

ARANET è una tecnologia innovativa senza fili che consente di monitorare e raccogliere in maniera continua, automatica, da remoto, i parametri ambientali dell'aria, del suolo/substrato, del clima, al fine di ottimizzare la produzione, massimizzarne la qualità, minimizzare i costi riducendo gli sprechi, eventualmente creando anche del valore aggiunto attraverso il tracciamento dei dati stessi e la loro condivisione con i partner e coi consumatori, per esempio in ottica blockchain.

Ideale per l'agricoltura protetta (serre, vivai, vertical farms, ...), ARANET è utile anche in campo aperto.

ARANET si può usare anche in zone assolutamente prive di infrastrutture di telecomunicazioni esistenti (non usa reti cellulari, né satellitari o altro), non prevede canoni mensili o annuali, né licenze SW.

Acquistando ARANET, il cliente acquisisce e possiede non solo la sensoristica e la base station ARANET, ma anche la tecnologia radio di trasporto dei dati, il database di raccolta dei dati incluso nella base station ARANET, il SW gratuito di analisi, allarmistica e reportistica, anch'esso incluso nella base station ARANET. **Temperatura dell'aria:** essenziale per fare previsioni sulla produzione e ottimizzare le condizioni di crescita.

Umidità Relativa dell'aria: necessario per favorire la traspirazione delle piante ed evitare i danni associati.

Temperatura del terreno/substrato: utile per schedulare correttamente semina, travasi, irrigazione, ...

Umidità del terreno: vitale per distribuire opportunamente l'acqua azzerando sprechi ed eccessi.

Elettroconducibilità: per evitare sprechi nell'uso di fertilizzante, usandolo solo quanto e dove serve.

pH: per identificare l'acidità del suolo/substrato, il suo contenuto nutritivo, quello batterico e la tossicità.

Diametro del fusto: le microvariazioni dello stelo sono indice di crescita, ma anche di eccessi di irrigazione.

Peso: utile per avere indicazioni su: crescita in biomassa, resa del raccolto, quantità di drenato, irriguo, ...

CO₂: in agricoltura protetta monitorare la CO₂ permette di ottimizzare la fotosintesi evitando gli eccessi.

PAR/Luminosità: permette di prevedere la resa del raccolto, oltre che forma, colore, struttura delle piante.
